

## Appendix A: Military Hangar Database

Following are definitions for the column headings in the hangar database. Information dating from the original hangar design and relating to the hangar bays themselves is favored. An exception is the *Square Feet* column. Many installations have disposed of their original property records, so current square footage figures are the only consistent data available.

**Service.** This column indicates which military service is currently responsible for the hangar described in that row. For example, the Navy may take responsibility for a hangar but lease it to the Air Force. In such a case, this study assumes that the Navy is responsible for any Section 106 compliance regarding the structure; the Air Force is simply a tenant.

**Installation.** This column indicates which DoD installation is responsible for the hangar. In most cases, this information implies the geographical location of the hangar. However, in some cases, an installation is responsible for structures off-site or at satellite locations; in such cases the parent installation is listed in the column with the actual hangar location shown in parentheses.

**Building Number.** This column lists the hangar's current building number as it appears in the installation's real property listing. It is common to find multiple hangar bays housed within a single building. This study recognizes building numbers rather than hangar numbers because an installation must consider the entire structure during Section 106 review. In cases where multiple building numbers are given to each in a series of attached hangars, each building number is represented.

**Year Built.** The significance of most hangars is tied to their construction dates. Entries here refer to construction completion dates. This date is used to set the hangar into its historic context so it can then be evaluated for significance. In a case where the construction date is unknown, the entry may comprise a range of years supplied by the installation. This study does not recognize relocation dates, when buildings are moved from one site to another, nor does it consider transfer dates, when buildings are passed from one owner to another.

**Era.** Each hangar in the database has been assigned an era based on its date of construction completion. Each era corresponds to a chapter in Part I. Note that a hangar may span two eras: the impetus, planning, and funding for it may be associated with one historical era while the construction was actually completed during the subsequent era. In such cases, both eras should be considered when determining building significance.

**P/SP/T.** This column shows the hangar's construction type as indicated in the installation's real property listing. P designates permanent construction, SP designates semipermanent construction, and T designates temporary construction. When the construction type has been altered, a nomenclature such as SP>P will appear. In this example, the hangar was upgraded from semipermanent to permanent construction. This designation indicates the expected service life of the building.

**Square Feet.** This column shows the building's current usable square footage as indicated on the installation's real property listing. For purposes of consistency, overall building values were used, including hangar bays, office modules, and other enclosed spaces attached to the building in question. This number was used to compare hangar sizes to hangar types.

**Use.** The current use of each hangar was given a designation of either *traditional* or *non-traditional*. The former refers to structures whose current use is consistent with its original use — the housing and maintenance of aircraft. The latter refers to structures whose current use differs from its original use, such as hangars that have been converted to office space.

**Plan Number.** This column shows the drawing number appearing on the architectural plans for the hangar. Modification drawing numbers were not used. When multiple drawing numbers were found, the number appearing on the first-floor plan was used. When the First Floor plan was missing, the first in the series of plan numbers was noted. This field is where standard plan numbers appear in the database. In some cases, multiple standard plan numbers correspond to one basic standard design. This may be due to variations on a theme, or the retirement of one standard plan number followed by the adoption of a new number. Although the Navy makes use of a standard plan design system, each of its hangar drawings is labeled with a unique Bureau of Yards and Docks number, which is more or less sequential.

**Plan Description.** Where available, the standard plan titles are listed. Where no reference to a standard plan is available, the hangar description, as it appears in

the title block of the architectural drawings, is listed. Where no standard plan title or title block description was found, the real property use/description is shown. A standard plan title should be examined in combination with a standard plan number in the previous column. Please note that a description such as “Maintenance” is much too general to use in typing a hangar.

**Structure.** When specific physical information on a hangar was provided by the installation, the hangar was categorized here according to primary structural material and system. *Structural material* refers to the way the material is formed, arranged, or combined so it can bear structural loads. Steel, for example, may be formed into a truss, girder, or long-span joist. A steel hangar may not be accurately typed without considering the structural system. It should be noted that this entry refers to structural materials and systems that span hangar bays rather than adjacent office modules or the like.

**Cross-Section.** A cross-section is a view that results from a vertical plane cutting through a building perpendicular to its length. Entries in this column generally designate internal and external hangar forms, such as gables or arches. A notation of *open* indicates that the internal structure follows the rise of the external form to some degree. *Closed* means the bottommost spanning structural component runs parallel to the floor plane. An open design allows greater tail clearance whereas a closed design is more rigid structurally. A cross-section entry without an *open* or *closed* designation is too general to use in typing a hangar. If insufficient information was available to make this determination, only the cross-sectional form is listed.

**n/a.** This entry indicates that the information did not exist or was not provided by the installation.

**Database Sort 1: Known DoD Aircraft Hangar Inventory Sorted by Service, Installation, and Building Number.**
